In HADeS, we assess your health status against conditions that are challenging to diagnose, ranging from neurodegenerative disorders to cancers and infectious diseases. Our commitment is to deliver timely guidance and rapid results, aiding you in anticipating, detecting, preventing, treating, and ultimately enhancing your quality of life. We provide preventive medicine services for persons of all ages who aspire to achieve **H**ealthy **A**ging by **D**etecting well-being in a single **S**can. With more than 20 years of experience in a technology that reads out the stability and balance of the blood proteome, we aim to democratize the health system.

HADeS Solutions is the connection between two fresh pillars in personal health management: the trend of self-diagnosis witnessed during the COVID-19 pandemic, and the commercially available at-home genomic kits that uncover health vulnerabilities. We fill the gap to complete an essential support for healthiness by informing people of their current global health status. Our proactive (not reactive) health management approach supports a decentralized Healthcare System (HCS) and meets the needs of a larger, longer-living population. Dedicated to enhancing our customers' well-being, we strive to alleviate strain on our overburdened HCS.

The HADeS Health Management Philosophy prioritizes prevention and health promotion through a holistic, simple, non-invasive routine approach. Diseases may manifest symptoms at a stage where treatment is less effective. We detect the presence of conditions even when symptoms are silent, just as the sound of our logo "H" symbolizes our vigilant approach to early detection. Our health-focused periodic check-ups aim to decrease disease prevalence and enhance mental well-being. Our health administration system extends from individual efforts to community-wide initiatives supporting policies aimed at longevity and encouraging a proactive culture.

HADeS Technology utilizes calorimetry to examine the thermal stability of biomolecules within the blood. Serum homeostasis functions as a dynamic surveillance system, akin to monitoring traffic along interconnected highways linking our organs, ensuring optimal functionality and health. HADeS simply analyzes the intricate equilibrium among vital biomolecules in our bloodstream, serving as a vigilant monitor of well-being. With just a drop of blood in an hour-long scan, we can monitor homeostasis. Our service enables customers to tackle diseases promptly, with on-demand access and absolute confidentiality and precision guaranteed by our AI machine learning interpretation software.

Let us empower you to assess your current health status, enabling proactive steps towards improvement when necessary. Unlike relying on speculative risk data, which may lead to potentially hazardous preemptive actions, we offer real-time insight into your well-being. Our approach complements a balanced and informed strategy for extending your lifespan.

At **HADeS**, we're driven by a passion for tackling health challenges and shaping our future. Our team believes in the power of cutting-edge technology to empower individuals and society. With blockchain innovation, we're revolutionizing healthcare. Guided by diverse advisors, we navigate science and management to foster innovation and human well-being.

Join us in our Decentralized Science (DeSci) adventure to promote longer and healthier lives.

Tokenomics

In Greek mythology, Hades, the enigmatic ruler of the underworld, held dominion over the unseen, mirroring the potential for disease lurking within us. We, at Hades, are here to shed light on what lies beneath the surface of your health.

HADeS uses advanced technology to uncover silent diseases and manages its ecosystem with commitment using the **H**ealthy **A**ge Token (HAT), the monetary system of Hades, our cap of **DeS**ci.
HAT tokens represent an innovative approach to democratizing funding for scientific research. These tokens function as your key to unlocking the power of decentralized, community-driven scientific research.

By participating as a beta tester and holding HAT tokens, you become an active contributor to access to cutting-edge health guides. With HAT and HADeS technology, anticipation, detection, prevention, remediation, will enhance your lifespan while maintaining a good well-being.

Supply and demand.

The Healthy Age token will be minted at the Token Generation Event (TGE) with a total of 4,260,000 -fixed supply- on Q3 2024 with no further issuance.
Following is the contract address of BPM: [blockchain SM address](#)
At TGE, HAT will be available as an EIP-4844 (Ethereum) token.

Token utilities, use case and open science.

DSC is a traditional 250 year-old technology that, applied in biofluids, can decode the state of your plasmatic protein homeostasis. In HADeS we have developed a simple, accurate, non-invasive and secure system that guides your Healthy Aging process at your will. HADeS measures and interprets Differential Scanning Calorimetry (DSC) **S**cans from plasma in order to **De**code your **H**ealthy **A**ging process. The DSC scan profiles, using just a tiny microliter sample, are processed with our open-source software, that continuously learns from the data, to determine your health status within one hour. HADeS outputs are confidential and untraceable, leveraging state-of-the-art artificial intelligence (AI) capabilities.

Through open science principles, we aim to share aggregated, de-identified data insights to contribute to the broader scientific community. HAT token holders will benefit from this collaborative approach, gaining access to personalized health insights while supporting collective knowledge advancement. Users will be capable of detecting hidden or silent health issues favoring longevity, just by holding HAT tokens. Any person will be able to gain HAT tokens by becoming a beta tester or compare their own DSC scan profiles using HADeS open-access software.

The usage of HAT is confined solely to the HAaDeS ecosystem, and possessing it confers no explicit or implicit privileges except for the ability to utilize HAT as a medium to facilitate usage and interaction within the mentioned ecosystem. Essentially, HAT is intended to stimulate engagement within the HaDeS ecosystem, implying that users must actively participate in order to receive rewards in the form of HAT tokens.
